

ABSTRACT

There is a system for selecting numbers for a lotto type lottery game. The system is such that each of the n cards includes a first side having a number from 1 to n thereon, and a second side, the second sides of all n cards being identical. The numbers on the front sides of each card are typically different and unique for each card of the n cards. A user selects m cards from the system of n cards, m corresponding to the amount of numbers needed to be selected for the particular lotto type lottery game.
